

IN THE CLAIMS:

1. (Cancelled)

2. (Original) A photographed image display device comprising:

a first LCD module and a second LCD module which each include a graphic memory operable to store image data and an LCD operable to display an image based on the image data stored in the graphic memory;

a photographing unit operable to form an optical image of an object, convert the formed optical image into image data, and output the image data sequentially;

a first transfer unit operable to receive the image data output from the photographing unit and transfer the image data to the graphic memory in the first LCD module;

a storage medium prestoring frame image data;

a judging unit operable to judge whether the transfer of the image data from the first transfer unit to the graphic memory in the first LCD module has been completed; and

a second transfer unit operable to, when the transfer has been completed, read the image data from the graphic memory in the first LCD module, combine the read image data and the frame image data so as to generate composite image data, and transfer the composite image data to the graphic memory in the second LCD module.

3. (Original) The photographed image display device of Claim 2, further comprising:

a storage instruction receiving unit operable to receive a storage instruction to store the composite image data into the storage medium; and

a storing unit operable to store the composite image data into the storage medium according to the storage instruction.

4. (Cancelled)

5. (Original) A photographed image display method for a photographed image display device including (i) a first LCD module and a second LCD module each including a graphic memory for temporarily storing image data and an LCD for displaying the image data, and (ii) a storage medium prestoring frame image data, the photographed image display method comprising:

a photographing step of forming an optical image of an object, converting the formed optical image into image data, and outputting the image data sequentially;

a first transfer step of receiving the image data output in the photographing step and transferring the image data to the graphic memory in the first LCD module;

a judging step of judging whether the transfer of the image data to the graphic memory in the first LCD module has been completed; and

a second transfer step of, when the transfer has been completed, reading the image data from the graphic memory in the first LCD module, combining the read image data and the frame image data so as to generate composite image data, and transferring the composite image data to the graphic memory in the second LCD module.

6. (Cancelled)

7. (Original) A mobile telephone including a photographed image display device, the photographed image display device comprising:

a first LCD module and a second LCD module which each include a graphic memory operable to store image data and an LCD operable to display an image based on the image data stored in the graphic memory;

a photographing unit operable to form an optical image of an object, convert the formed optical image into image data, and output the image data sequentially;

a first transfer unit operable to receive the image data output from the photographing unit and transfer the image data to the graphic memory in the first LCD module;

a storage medium prestoring frame image data;

a judging unit operable to judge whether the transfer of the image data from the first transfer unit to the graphic memory in the first LCD module has been completed; and

a second transfer unit operable to, when the transfer has been completed, read the image data from the graphic memory in the first LCD module, combine the read image data and the frame image data so as to generate composite image data, and transfer the composite image data to the graphic memory in the second LCD module.

8. (Cancelled)

9. (Original) A photographed image display program used for a photographed image display device including (i) a first LCD module and a second LCD module each having a graphic memory for temporarily storing image data and an LCD for displaying the image data, and (ii) a storage medium prestoring frame image data, the photographed image display program comprising:

a photographing step of forming an optical image of an object, converting the formed optical image into image data, and outputting the image data sequentially;

a first transfer step of receiving the image data output in the photographing step and transferring the image data to the graphic memory in the first LCD module;

a judging step of judging whether the transfer of the image data to the graphic memory in the first LCD module has been completed; and

a second transfer step of, when the transfer has been completed, reading the image data from the graphic memory in the first LCD module, combining the read image data and the frame image data so as to generate composite image data, and transferring the composite image data to the graphic memory in the second LCD module.

10. (New) In a mobile telephone for receiving and transmitting audio and image data, the improvement comprising:

a camera unit operable to form an optical image of an object, convert the optical image into image data and output the image data;

a first storage assembly including a storage unit for storing multiple image data and a pair of graphic memories each capable of storing single image data;

a pair of LCD members each capable of displaying image data from one of the graphic

memories; and

a control unit for receiving an input instruction from a user to enable the camera unit to execute the formation and outputting of the image data to initially one of the graphic memories and subsequently for storage in the storage unit and to enable one of the LCD members to display image data from either one of the graphics memories or a combination of image data from the pair of graphic memories.
